Analyte description	CRP is a member of the class of acute-phase reactants, as its levels rise dramatically during inflammatory processes occurring in the body. CRP rises up to 50,000-fold in acute inflammation, such as infection. It rises above normal limits within 6 hours, and peaks at 48 hours. Its half-life is constant, and therefore its level is mainly determined by the rate of production (and hence the severity of the precipitating cause). CRP is used mainly as a marker of inflammation. Measuring and charting CRP values can prove useful in determining disease progress or the effectiveness of treatments.

Miscellaneous	Note that CRP is a pentameric protein. The same antibody can thus be used both as a capture and a detection antibody. Binding of CRP by antibody 6404 is not inhibited by EDTA or phosphorylcholine (Käpyaho et al. 1989). Antibody 6404 has been used to develop a high sensitivity/broad range CRP assay with a detection limit of 0.16 µg/L and 0.064 – 1200 mg/L measuring range with a 400-fold dilution (Tarkkinen et al. 2002).
